CH 3

The Hopf algebra  $U_q(\mathfrak{g})$  $\mathfrak{g}$  = f.d. s.s. Lie algebra

where

To motivate  $U_q(\mathfrak{g})$  for general  $\mathfrak{g}$ ,first consider  $\mathfrak{g} = \mathfrak{sl}_{n+1}$ Recall Lie algebra  $\mathfrak{sl}_{n+1}$ For moment assume  $\mathbb{F} = \mathbb{C}$ View  $\mathfrak{sl}_{n+1} = \left\{ x \in \text{Mat}_{n+1}(\mathbb{F}) \mid \text{tr}(x) = 0 \right\}$ 

Lie bracket

$$[x, y] = xy - yx$$

 $x, y \in \mathfrak{sl}_{n+1}$ Structure of  $\mathfrak{sl}_{n+1}$  is described by Cartan matrix

$$A = \begin{pmatrix} 2 & -1 & & & & \\ -1 & 2 & -1 & & & \\ & -1 & \ddots & \ddots & & \\ & & \ddots & \ddots & \ddots & \\ & & & & 2 & -1 \\ 0 & & & & -1 & 2 \end{pmatrix}_{n \times n}$$

as we now explain.

Notation For  $i \in \{1, \dots, n\}$

$$E_{ij} \in \text{Mat}_{nn}(\mathbb{R})$$

has  $(i,j)$ -entry 1 and all other entries 0

Generators of Lie alg sl<sub>n</sub>:

$$e_i = E_{i,i+1} \quad \text{is gen}$$

$$f_i = E_{i+1,i}$$

$$h_i = E_{ii} - E_{i+1,i+1}$$

Relations for sl<sub>n</sub>

$$(i) \quad [e_i, f_j] = \delta_{ij} h_i \quad 1 \leq i, j \leq n$$

$$(ii) \quad [h_i, h_j] = 0$$

$$(iii) \quad [h_i, e_j] = A_{ij} e_j$$

$$(iv) \quad [h_i, f_j] = -A_{ij} f_j$$

$$(v) \quad (\text{ad } e_i)^{1-A_{ij}} (e_j) = 0 \quad \text{if } i \neq j$$

$$(vi) \quad (\text{ad } f_i)^{1-A_{ij}} (f_j) = 0 \quad \text{if } i \neq j$$

where  $\text{ad } x (y) = [x, y]$

By Serre's thm,  $\text{sl}_n$  is iso to the Lie algebra

over  $\mathbb{F}$  generated by symbols  $e_i, f_i, h_i$  ( $1 \leq i \leq n$ )

subject to relations (i) — (vi) above.

Also the unir enveloping alg  $U(\text{sl}_n)$  is the assoc

algebra with gens  $e_i, f_i, h_i$  ( $1 \leq i \leq n$ ) and relations

(i) — (vi) above, where we interpret  $[x, y] = xy - yx$

Observations

- $F_n$  is a Lie algebra.  
 $e_i, f_i, h_i$  span a  $Lic$  subalgebra  
 of dimension at least 2.
- Ref to (v) above, in  $U(\text{sl}_n)$  the LHS is
 
$$\sum_{\alpha=0}^{1-A_{ij}} \binom{1-A_{ij}}{\alpha} (-1)^{\alpha} e_i^{1-A_{ij}-\alpha} e_j e_i^{\alpha}$$

DEF/ Field  $\mathbb{F}$  arb

$o \neq q \in \mathbb{F}$  not root of 1

For  $n \geq 1$  the algebra  $U_q(\text{sl}_n)$  has

gens

$e_i, f_i, k_i, k_i^{-1}$  rels

and relations

$$(i) \quad k_i k_i^{-1} = k_i^{-1} k_i = 1 \quad \text{rel 1}$$

$$(ii) \quad k_i k_j = k_j k_i \quad 1 \leq i, j \leq n$$

$$(iii) \quad k_i e_j k_i^{-1} = q^{A_{ij}} e_j \quad \dots$$

$$(iv) \quad k_i f_j k_i^{-1} = q^{-A_{ij}} f_j \quad \dots$$

$$(v) \quad e_i f_j - f_j e_i = \delta_{ij} \frac{k_i - k_i^{-1}}{q - q^{-1}} \quad \dots$$

$$(vi) \quad \sum_{a=0}^{1-A_{ij}} \left[ \begin{matrix} 1-A_{ij} \\ a \end{matrix} \right]_q (-1)^a e_i^{1-A_{ij}-a} e_j e_i^a = 0 \quad \text{if } i \neq j$$

$$(vii) \quad \sum_{a=0}^{1+A_{ij}} \left[ \begin{matrix} 1+A_{ij} \\ a \end{matrix} \right]_q (-1)^a f_i^{1+A_{ij}-a} f_j f_i^a = 0 \quad \text{if } i \neq j$$

Next goalDefine  $u_g(g)$  for a f.d. ss locally  $\mathbb{G}$ Needed facts on  $\mathfrak{g}$ For time being assume  $\mathbb{F} = \mathbb{C}$ Recall a f.d. Lie alg  $\mathfrak{g}$  over  $\mathbb{C}$  is semi-simple iff it is  
a direct sum of simple Lie algebras over  $\mathbb{C}$ .The simple Lie algebras over  $\mathbb{C}$  are $A_n, B_n, C_n, D_n, E_6, E_7, E_8, F_4, G_2$ Let  $\mathfrak{g} =$  f.d. ss Lie alg /  $\mathbb{C}$ .We associate with  $\mathfrak{g}$  a Cartan matrix  $A$ .For  $\mathfrak{g}$  simple,  $A$  is given in handoutFor  $\mathfrak{g} = \mathfrak{g}_1 \oplus \mathfrak{g}_2 \oplus \dots \oplus \mathfrak{g}_r$  ( $\mathfrak{g}_i$  simple),

$$A = \left( \begin{array}{c|c|c|c} A_1 & & & \textcircled{0} \\ \hline & A_2 & & \\ \hline & & \ddots & \\ \textcircled{0} & & & A_r \end{array} \right)$$

 $A_i = \text{Cartan matrix}$   
 $\text{for } \mathfrak{g}_i$ 
By the rank of  $\mathfrak{g}$  we mean  $n$  where  $A$  is  $n \times n$

The restrictions on  $\ell$  for types  $A_\ell$ – $D_\ell$  are imposed in order to avoid duplication. Relative to the indicated numbering of simple roots, the corresponding Cartan matrices are given in Table 1. Inspection of the diagrams listed above reveals that in all cases except  $B_\ell$ ,  $C_\ell$ , the Dynkin diagram can be deduced from the Coxeter graph. However,  $B_\ell$  and  $C_\ell$  both come from a single Coxeter graph, and differ in the relative numbers of short and long simple roots. (These root systems are actually dual to each other, cf. Exercise 5.)

*Proof of Theorem.* The idea of the proof is to classify first the possible Coxeter graphs (ignoring relative lengths of roots), then see what Dynkin diagrams result. Therefore, we shall merely apply some elementary euclidean geometry to finite sets of vectors whose pairwise angles are those prescribed by the Coxeter graph. Since we are ignoring lengths, it is easier to work for the time being with sets of unit vectors. For maximum flexibility, we make

Fact 1  $\det A > 0$ . In particular  $A^{-1}$  exists.

Fact 2  $A$  is symmetrizable. This means  
 $\exists$  pos integers  $\{d_i\}_{i=1}^n$  ( $n = \text{rank } A$ )

such

$$\begin{pmatrix} d_1 & 0 \\ d_2 & \ddots & 0 \\ 0 & \ddots & d_n \end{pmatrix} A \quad \text{is symmetric}$$

the  $d_i$  are not unique in gen.

We normalize the  $d_i$  so that

For g simple  $1 = \max \{d_i \mid \text{even}\}$

For gen g For each simple component of  $\mathcal{I}$   
 the correxp  $d_i$  are normalized as above.
