

Math 240, Fall Semester 2001-02

NAME:

(Prof.) R.A. Brualdi

Exam 1: October 12, 2001,

Total Points:

[points in brackets]

1. [15 points] (a) Partition the propositions into groups whereby each pair of propositions in the same group are logically equivalent while two propositions in different groups are not logically equivalent:

$$p \rightarrow q,$$

$$\neg q \rightarrow \neg p,$$

$$\neg(p \vee q),$$

$$p \vee \neg q,$$

$$\neg(\neg p \wedge q),$$

$$\neg p \vee q.$$

$$p \rightarrow q, \neg q \rightarrow \neg p, \neg p \vee q$$

$$p \vee \neg q, \neg(\neg p \wedge q)$$

$$\neg(p \vee q)$$

(b) Let the variable  $x$  in the predicates  $P(x)$ ,  $Q(x)$ , and  $R(x)$  vary over a universe  $U$ . Let

$$A = \{x | P(x) \text{ is true}\}, B = \{x | Q(x) \text{ is true}\}, \text{ and } C = \{x | R(x) \text{ is true}\}$$

be the truth sets of  $P(x)$ ,  $Q(x)$  and  $R(x)$ . Using only the set operations union and complement, give the truth sets of:

(i)  $(P(x) \wedge Q(x)) \vee \neg R(x)$ :

$$(A \cap B) \cup (\overline{C})$$

(ii)  $P(x) \rightarrow Q(x)$ :

$$\overline{A} \cup B$$

(ii)  $P(x) \leftrightarrow Q(x)$ :

$$(A \cap B) \cup (\overline{A} \cap \overline{B})$$

2. [10 points] (a) How many different Boolean functions of  $n$  Boolean variables are there? Justify your answer.

$$2^{2^n}$$

(b) Let  $x, y, z$  be Boolean variables. Express the Boolean function  $f(x, y, z)$  using only the Boolean operations  $+$ ,  $\cdot$ , and  $\bar{\phantom{x}}$ :

$$f(x, y, z) = 1 \text{ if and only if an odd number of } x, y, z \text{ have value 1.}$$
$$x\bar{y}\bar{z} + \bar{x}y\bar{z} + \bar{x}\bar{y}z + xyz$$

3. [15 points] (a) Which of the following functions are injective (one to one), surjective (onto), bijective (one to one and onto), or none of the above. If bijective, give the inverse. (Here  $Z$  is the set of all integers,  $Z^+$  is the set of positive integers, and  $\mathcal{P}(S)$  denotes the collection of all subsets of a set  $S$ .)

$$f : Z^+ \rightarrow Z^+, f(x) = x + 1.$$

injective

$$f : Z \rightarrow Z, f(x) = x + 1.$$

bijective;  $f^{-1}(x) = x - 1$

$$f : \mathcal{P}(S) \rightarrow \mathcal{P}(S), f(X) = \overline{X}.$$

bijective;  $f^{-1}(A) = \overline{A}$

$$f : \mathcal{P}(S) \rightarrow \mathcal{P}(S), f(X) = X \cap A \text{ where } A \text{ is a fixed subset of } S.$$

neither in general

(b) Consider the function  $f : \mathfrak{R} \rightarrow Z$  defined by  $f(x) = \lceil x - \frac{1}{2} \rceil$ . Determine the inverse image of 3.

$$\lceil x - 1/2 \rceil = 3 \text{ iff } 2 < x - 1/2 \leq 3 \text{ iff } 5/2 < x \leq 7/2$$

4. [20 points] (a) Use the Euclidean algorithm to find the multiplicative inverse of 20 modulo 51 (*Trial and error not accepted*).

inverse of 20 mod 51 is 23

(b) Does  $20x \equiv 4 \pmod{51}$  have a solution  $x$ ? If so, find it. Is this solution unique modulo 51? **Explain.**

YES:  $x \equiv (20)^{-1} \cdot 4 \pmod{51} \equiv 23 \cdot 4 \pmod{51} \equiv 92 \pmod{51} \equiv 41 \pmod{51}$ .

(c) Note that  $11 \cdot 3 \equiv 1 \pmod{32}$ . Use this fact to find the 11th root of 31 modulo 51, i.e. a number  $a$  such that  $a^{11} \equiv 31 \pmod{51}$ .

This question was thrown out.

5. [20 points] We have  $385 = 5 \cdot 7 \cdot 11$ .

(a) Use the Chinese Remainder Theorem to explain how to represent every integer  $n$  with  $0 \leq n \leq 384$  **uniquely** as a three tuple of integers  $(a_1, a_2, a_3)$  where  $0 \leq a_1 \leq 2$ ,  $0 \leq a_2 \leq 6$ , and  $0 \leq a_3 \leq 10$ . You must explain the uniqueness.

We did not do this.

(b) What three tuple represents 200?

We did not do this.

(c) Under what conditions does the following hold:

$$a|c \text{ and } b|c \text{ implies } ab|c?$$

(Here  $a, b, c$  are positive integers.)

When  $a$  and  $b$  are relatively prime.

6. [10 points] Consider the functions below and list them from top to bottom (smallest order of magnitude to largest) putting functions  $f$  and  $g$  in the same line if  $f = \Theta(g)$ :

$$n^4, \quad 2^n, \quad n \log n, \quad n^2, \quad 5^n, \quad n \log n^4, \quad \sqrt{n}.$$

$$\sqrt{n}, \text{ both of } n \log n, n \log n^4, n^2, n^4, 2^n, 5^n$$

7. [10 points] Prove by mathematical induction:

$$\frac{1}{1 \cdot 3} + \frac{1}{3 \cdot 5} + \cdots + \frac{1}{(2n-1) \cdot (2n+1)} = \frac{n}{2n+1} \quad (n \geq 1).$$

We haven't done this yet.
