The Turing universe in context

CiE 2013 1 / 30

How can a set of natural numbers *B* be used to define a set of natural numbers *A*.

How can a set of natural numbers *B* be used to define a set of natural numbers *A*.

There is an algorithm, which determines whether *x* ∈ *A* using finite information about memberships in *B*: Turing reducibility.

How can a set of natural numbers *B* be used to define a set of natural numbers *A*.

- There is an algorithm, which determines whether *x* ∈ *A* using finite information about memberships in *B*: Turing reducibility.
- There is an algorithm, which enumerates instances of memberships in *A* from instances of memberships in *B*: enumeration reducibility.

There is an algorithm, which determines whether $x \in A$ using finite information about memberships in *B*.

 Algorithm: A Turing machine, or a program written in any common programming language or a natural number: φ_e.

A (10) > A (10) > A (10)

There is an algorithm, which determines whether $x \in A$ using finite information about memberships in *B*.

- Algorithm: A Turing machine, or a program written in any common programming language or a natural number: φ_e.
- The algorithm is allowed to consult an *oracle*: φ_e^B .

< 回 ト < 三 ト < 三

There is an algorithm, which determines whether $x \in A$ using finite information about memberships in *B*.

- Algorithm: A Turing machine, or a program written in any common programming language or a natural number: φ_e.
- The algorithm is allowed to consult an *oracle*: φ_e^B .
- A ≤_T B if an only if the characteristic function of A is computable using oracle B: χ_A = φ^B_e for some e.

周レイモレイモ

There is an algorithm, which determines whether $x \in A$ using finite information about memberships in *B*.

- Algorithm: A Turing machine, or a program written in any common programming language or a natural number: φ_e.
- The algorithm is allowed to consult an *oracle*: φ_e^B .
- A ≤_T B if an only if the characteristic function of A is computable using oracle B: χ_A = φ^B_e for some e.

Example

Let *B* be any set of natural numbers.

• Every computable set is Turing reducible to B.

There is an algorithm, which determines whether $x \in A$ using finite information about memberships in *B*.

- Algorithm: A Turing machine, or a program written in any common programming language or a natural number: φ_e.
- The algorithm is allowed to consult an *oracle*: φ_e^B .
- A ≤_T B if an only if the characteristic function of A is computable using oracle B: χ_A = φ^B_e for some e.

Example

Let *B* be any set of natural numbers.

- Every computable set is Turing reducible to B.
- $B \leq_T B$ and if $C \leq_T D$ and $D \leq_T B$ then $C \leq_T B$.

There is an algorithm, which determines whether $x \in A$ using finite information about memberships in *B*.

- Algorithm: A Turing machine, or a program written in any common programming language or a natural number: φ_e.
- The algorithm is allowed to consult an *oracle*: φ_e^B .
- A ≤_T B if an only if the characteristic function of A is computable using oracle B: χ_A = φ^B_e for some e.

Example

Let *B* be any set of natural numbers.

- Every computable set is Turing reducible to B.
- $B \leq_T B$ and if $C \leq_T D$ and $D \leq_T B$ then $C \leq_T B$.
- The halting set relative to B, denoted as K_B = {n | φ_n^B(n) halts} is not Turing reducible to B.

Scooping the loop snooper

Scooping the loop snooper

Geoffrey K. Pullum

. . .

. . .

. . .

For imagine we have a procedure called P that for specified input permits you to see whether specified source code, with all of its faults, defines a routine that eventually halts.

Well, the truth is that P cannot possibly be, because if you wrote it and gave it to me, I could use it to set up a logical bind that would shatter your reason and scramble your mind.

There is an algorithm, which enumerates instances of memberships in *A* from instances of memberships in *B*.

There is an algorithm, which enumerates instances of memberships in *A* from instances of memberships in *B*.

We have an algorithm which enumerates a list of axioms: (x, D): a c.e. set W_e.

There is an algorithm, which enumerates instances of memberships in A from instances of memberships in B.

- We have an algorithm which enumerates a list of axioms: (x, D): a c.e. set W_e.
- The oracle set *B* is revealing it elements one by one in some order.

There is an algorithm, which enumerates instances of memberships in A from instances of memberships in B.

- We have an algorithm which enumerates a list of axioms: (x, D): a c.e. set W_e.
- The oracle set *B* is revealing it elements one by one in some order.
- We combine both enumerations into one: If we see an axiom (x, D) and all of the elements in D have been enumerated by the oracle then we enumerate x: W_e(B)

There is an algorithm, which enumerates instances of memberships in A from instances of memberships in B.

- We have an algorithm which enumerates a list of axioms: (x, D): a c.e. set W_e.
- The oracle set *B* is revealing it elements one by one in some order.
- We combine both enumerations into one: If we see an axiom (x, D) and all of the elements in D have been enumerated by the oracle then we enumerate x: W_e(B)

•
$$A \leq_e B$$
 if $A = W_e(B)$ for some e .

There is an algorithm, which enumerates instances of memberships in A from instances of memberships in B.

- We have an algorithm which enumerates a list of axioms: (x, D): a c.e. set W_e.
- The oracle set *B* is revealing it elements one by one in some order.
- We combine both enumerations into one: If we see an axiom (x, D) and all of the elements in D have been enumerated by the oracle then we enumerate x: W_e(B)

•
$$A \leq_e B$$
 if $A = W_e(B)$ for some e .

Example

Let *B* be any set of natural numbers.

• Every computably enumerable set is enumeration reducible to B.

There is an algorithm, which enumerates instances of memberships in A from instances of memberships in B.

- We have an algorithm which enumerates a list of axioms: (x, D): a c.e. set W_e.
- The oracle set *B* is revealing it elements one by one in some order.
- We combine both enumerations into one: If we see an axiom (x, D) and all of the elements in D have been enumerated by the oracle then we enumerate x: W_e(B)

•
$$A \leq_e B$$
 if $A = W_e(B)$ for some e .

Example

Let *B* be any set of natural numbers.

$$DS_e(G) = \{ a \mid a \in TOT \& s_G \leq_e a \}$$

 By Selman's Theorem s_G is completely determined by the set of total degrees above it.

CiE 2013 15 / 30

< A > < A > >

$$DS_e(G) = \{ \mathbf{a} \mid \mathbf{a} \in \mathcal{TOT} \& \mathbf{s}_G \leq_e \mathbf{a} \}$$

- By Selman's Theorem s_G is completely determined by the set of total degrees above it.
- G has a degree (both e- and T-) if and only if the type degree s_G is total.

$$DS_e(G) = \{ \mathbf{a} \mid \mathbf{a} \in \mathcal{TOT} \& \mathbf{s}_G \leq_e \mathbf{a} \}$$

- By Selman's Theorem s_G is completely determined by the set of total degrees above it.
- G has a degree (both e- and T-) if and only if the type degree s_G is total.
- If *G* has an e-degree then this e-degree is precisely **s**_{*G*}.

$$DS_e(G) = \{ \mathbf{a} \mid \mathbf{a} \in \mathcal{TOT} \& \mathbf{s}_G \leq_e \mathbf{a} \}$$

- By Selman's Theorem s_G is completely determined by the set of total degrees above it.
- G has a degree (both e- and T-) if and only if the type degree s_G is total.
- If *G* has an e-degree then this e-degree is precisely **s**_{*G*}.
- By Soskov's Jump inversion Theorem G always has first jump degree (both e- and T-) and it is s[']_G.

- **2** A degree **a** is high if $\mathbf{a}' = \mathbf{0}''$.

Theorem (Shore (2012))

The high degrees are first order definable in $\mathcal{D}_T (\leq \mathbf{0}')$.

- **①** The theory of first order arithmetic can be interpreted $\mathcal{D}_T (\leq \mathbf{0}')$.
- **②** There is a definable way of mapping a degree **a** to a set *A* in any interpretation of arithmetic so that $A'' \in \mathbf{a}''$.

A (10) A (10)

Definition

- A degree **a** is low if $\mathbf{a}' = \mathbf{0}'$.
- **2** A degree **a** is high if $\mathbf{a}' = \mathbf{0}''$.

Theorem (Shore (2012))

The high degrees are first order definable in $\mathcal{D}_T (\leq \mathbf{0}')$.

- **()** The theory of first order arithmetic can be interpreted $\mathcal{D}_T (\leq \mathbf{0}')$.
- **②** There is a definable way of mapping a degree **a** to a set *A* in any interpretation of arithmetic so that $A'' \in \mathbf{a}''$.
- Every relation which is invariant under double jump and definable in arithmetic is definable.

Definition

- A degree **a** is low if $\mathbf{a}' = \mathbf{0}'$.
- **2** A degree **a** is high if $\mathbf{a}' = \mathbf{0}''$.

Theorem (Shore (2012))

The high degrees are first order definable in $\mathcal{D}_T (\leq \mathbf{0}')$.

- **()** The theory of first order arithmetic can be interpreted $\mathcal{D}_T (\leq \mathbf{0}')$.
- **②** There is a definable way of mapping a degree **a** to a set *A* in any interpretation of arithmetic so that $A'' \in \mathbf{a}''$.
- Every relation which is invariant under double jump and definable in arithmetic is definable.
- An additional structural property by Nies, Shore and Slaman (1998).

Definition

- A degree **a** is low if $\mathbf{a}' = \mathbf{0}'$.
- **2** A degree **a** is high if $\mathbf{a}' = \mathbf{0}''$.

Theorem (Shore (2012))

The high degrees are first order definable in $\mathcal{D}_T (\leq \mathbf{0}')$.

- The theory of first order arithmetic can be interpreted $\mathcal{D}_T (\leq \mathbf{0}')$.
- **②** There is a definable way of mapping a degree **a** to a set *A* in any interpretation of arithmetic so that $A'' \in \mathbf{a}''$.
- Every relation which is invariant under double jump and definable in arithmetic is definable.
- An additional structural property by Nies, Shore and Slaman (1998).

It is not known if the low degrees are first order definable in $\mathcal{D}_{\mathcal{I}}(\leq \mathbf{0}'_{\mathcal{I}})_{\sim}$

Mariya I. Soskova (Sofia University)

The Turing universe in context

Definability in the local structure of the enumeration degrees

Initial motivation: Prove that the theory of first order arithmetic is interpretable in $\mathcal{D}_e(\leq \mathbf{0}'_e)$.

A (10) A (10) A (10)

Definability in the local structure of the enumeration degrees

Initial motivation: Prove that the theory of first order arithmetic is interpretable in $\mathcal{D}_e(\leq \mathbf{0}'_e)$.

Theorem (Slaman, Woodin (1997))

The theory of $\mathcal{D}_e(\leq \mathbf{0}'_e)$ is undecidable.

Idea: Use \mathcal{K} -pairs to extend this result.

A > + = + + =

$$\mathcal{K}(\textbf{a},\textbf{b}) \leftrightarrows (\forall \textbf{x})((\textbf{a} \lor \textbf{x}) \land (\textbf{b} \lor \textbf{x}) = \textbf{x})$$

Theorem (Ganchev, S)

The first order theory of $\mathcal{D}_e(\leq \mathbf{0}'_e)$ is computably isomorphic to the first order theory of true arithmetic.

Mariya I. Soskova (Sofia University)

< ロ > < 同 > < 回 > < 回 >

A surprising consequence

Extending a result of Giorgi, Sorbi and Yang:

Theorem (Ganchev, S)

An enumeration degree **a** is low if and only if every degree $\mathbf{b} \leq_e \mathbf{a}$ bounds a \mathcal{K} -pair.

The class L_1 is first order definable in $\mathcal{D}_e (\leq \mathbf{0}'_e)$.

A (10) A (10) A (10)

A surprising consequence

Extending a result of Giorgi, Sorbi and Yang:

Theorem (Ganchev, S)

An enumeration degree **a** is low if and only if every degree $\mathbf{b} \leq_e \mathbf{a}$ bounds a \mathcal{K} -pair.

The class L_1 is first order definable in $\mathcal{D}_e (\leq \mathbf{0}'_e)$.

Extending Jouckusch's theorem:

Theorem (Ganchev, S)

A degree $\mathbf{a} \leq_{e} \mathbf{0}'_{e}$ is total if and only if it is the least upper bound of a maximal \mathcal{K} -pair.

The class of total degrees is first order definable in $\mathcal{D}_e(\leq \mathbf{0}'_e)$.

We know that:

• $\mathcal{TOT} \cap \mathcal{D}_e (\geq \mathbf{0}'_e)$ is first order definable.

We know that:

- $\mathcal{TOT} \cap \mathcal{D}_e (\geq \mathbf{0}'_e)$ is first order definable.
- $TOT \cap D_e (\leq \mathbf{0}'_e)$ is first order definable.

< 回 > < 回 > < 回

We know that:

- $TOT \cap D_e (\geq \mathbf{0}'_e)$ is first order definable.
- $\mathcal{TOT} \cap \mathcal{D}_e(\leq \mathbf{0}'_e)$ is first order definable.

Question (Rogers 1967)

Is TOT first order definable in D_e ?

(4) (5) (4) (5)

We know that:

- $TOT \cap D_e (\geq \mathbf{0}'_e)$ is first order definable.
- $\mathcal{TOT} \cap \mathcal{D}_e(\leq \mathbf{0}'_e)$ is first order definable.

Question (Rogers 1967)

Is TOT first order definable in D_e ?

Recall that the total degrees are an automorphism base for \mathcal{D}_e .

- E 🕨

We know that:

- $TOT \cap D_e (\geq \mathbf{0}'_e)$ is first order definable.
- $\mathcal{TOT} \cap \mathcal{D}_e(\leq \mathbf{0}'_e)$ is first order definable.

Question (Rogers 1967)

Is TOT first order definable in D_e ?

Recall that the total degrees are an automorphism base for \mathcal{D}_e .

A positive answer would connect the problems of the existence of a non-trivial automorphism in both structures.

A B F A B F
One step further in the dream world

```
Theorem (Ganchev,S)
```

```
For every nonzero enumeration degree \mathbf{u} \in \mathcal{D}_{e},
```

```
\mathbf{u}' = max \left\{ \mathbf{a} \lor \mathbf{b} \mid \mathcal{K}(\mathbf{a}, \mathbf{b}) \& \mathbf{a} \leq_{e} \mathbf{u} \right\}.
```

< 回 ト < 三 ト < 三

One step further in the dream world

Theorem (Ganchev,S)

For every nonzero enumeration degree $\mathbf{u} \in \mathcal{D}_{e}$,

```
\mathbf{u}' = max \left\{ \mathbf{a} \lor \mathbf{b} \mid \mathcal{K}(\mathbf{a}, \mathbf{b}) \& \mathbf{a} \leq_{e} \mathbf{u} \right\}.
```

- Suppose that a degree is total if and only if it is the least upper bound of a maximal *K*-pair.
- The relation **x** is c.e. in **u** would also be definable for total degrees by :

$$\exists a \exists b (x = a \lor b \& \mathcal{K}(a, b) \& a \leq_e u).$$

One step further in the dream world

Theorem (Ganchev,S)

For every nonzero enumeration degree $\mathbf{u} \in \mathcal{D}_{e}$,

```
\mathbf{u}' = max \left\{ \mathbf{a} \lor \mathbf{b} \mid \mathcal{K}(\mathbf{a}, \mathbf{b}) \& \mathbf{a} \leq_{e} \mathbf{u} \right\}.
```

- Suppose that a degree is total if and only if it is the least upper bound of a maximal *K*-pair.
- The relation **x** is c.e. in **u** would also be definable for total degrees by :

$$\exists \mathsf{a} \exists \mathsf{b}(\mathsf{x} = \mathsf{a} \lor \mathsf{b} \& \mathcal{K}(\mathsf{a}, \mathsf{b}) \& \mathsf{a} \leq_{e} \mathsf{u}).$$

 Then for total u, our definition of the jump would read u' is the largest total degree, which is c.e. in u.

(A) (B) (A) (B)

Let \mathcal{D} be the structure of the Turing degrees or the structure of the enumeration degrees.

Let \mathcal{D} be the structure of the Turing degrees or the structure of the enumeration degrees.
