## Enumeration reducibility

#### Definition

#### $A \leq_e B$ if there is a c.e. set W, such that

$$A = W(B) = \{x \mid \exists D(\langle x, D \rangle \in W \& D \subseteq B)\}.$$

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

## Enumeration reducibility

#### Definition

 $A \leq_e B$  if there is a c.e. set W, such that

 $A = W(B) = \{x \mid \exists D(\langle x, D \rangle \in W \& D \subseteq B)\}.$ 

• 
$$d_e(A) = \{B \mid A \leq_e B \& B \leq_e A\}.$$

•  $d_e(A) \leq d_e(B)$  if  $A \leq_e B$ .

• 
$$d_e(A \oplus B) = d_e(A) \lor d_e(B)$$
.

• 
$$d_e(A)' = d_e(L_A \oplus \overline{L_A})$$
, where  $L_A = \{e \mid e \in W_e(A)\}$ .

# Enumeration reducibility

#### Definition

(

 $A \leq_e B$  if there is a c.e. set W, such that

 $A = W(B) = \{x \mid \exists D(\langle x, D \rangle \in W \& D \subseteq B)\}.$ 

• 
$$d_e(A) = \{B \mid A \leq_e B \& B \leq_e A\}.$$

• 
$$d_e(A) \leq d_e(B)$$
 if  $A \leq_e B$ .

• 
$$\mathbf{0}_e = d_e(\emptyset)$$
 consists of all c.e. sets.

• 
$$d_e(A \oplus B) = d_e(A) \lor d_e(B)$$
.

• 
$$d_e(A)' = d_e(L_A \oplus \overline{L_A})$$
, where  $L_A = \{e \mid e \in W_e(A)\}$ .

 $\mathcal{D}_e=\langle D_e,\leq,\vee,'\,\mathbf{0}\rangle$  is an upper semi-lattice with least element and jump operation.

#### Proposition

## $A \leq_T B \Leftrightarrow A \oplus \overline{A} \text{ is c.e. in } B \Leftrightarrow A \oplus \overline{A} \leq_e B \oplus \overline{B}.$

## What connects $\mathcal{D}_{\mathcal{T}}$ and $\mathcal{D}_{e}$

### Proposition

## $A \leq_T B \Leftrightarrow A \oplus \overline{A} \text{ is c.e. in } B \Leftrightarrow A \oplus \overline{A} \leq_e B \oplus \overline{B}.$

The embedding  $\iota : \mathcal{D}_T \to \mathcal{D}_e$ , defined by  $\iota(d_T(A)) = d_e(A \oplus \overline{A})$ , preserves the order, the least upper bound and the jump operation.

A (10) A (10)

### Proposition

## $A \leq_T B \Leftrightarrow A \oplus \overline{A} \text{ is c.e. in } B \Leftrightarrow A \oplus \overline{A} \leq_e B \oplus \overline{B}.$

The embedding  $\iota : \mathcal{D}_T \to \mathcal{D}_e$ , defined by  $\iota(d_T(A)) = d_e(A \oplus \overline{A})$ , preserves the order, the least upper bound and the jump operation.

The substructure of the total e-degrees is defined as  $TOT = \iota(D_T)$ .

# Defining the Turing jump operator

### Theorem (Shore, Slaman)

The Turing jump operator is first order definable in  $\mathcal{D}_{T}$ .

The double jump is first order definable in D<sub>T</sub>: Slaman and Woodin's analysis of the automorphisms of the Turing degrees and "involves explicit translation of automorphism facts in definability facts via a coding of second order arithmetic".

< 回 ト < 三 ト < 三

# Defining the Turing jump operator

### Theorem (Shore, Slaman)

The Turing jump operator is first order definable in  $\mathcal{D}_T$ .

- The double jump is first order definable in D<sub>T</sub>: Slaman and Woodin's analysis of the automorphisms of the Turing degrees and "involves explicit translation of automorphism facts in definability facts via a coding of second order arithmetic".
- 2 An additional structural fact: for every  $\mathbf{a} \leq_{\mathcal{T}} \mathbf{0}'_{\mathcal{T}}$  there is  $\mathbf{g}$  such that  $\mathbf{a} \lor \mathbf{g} = \mathbf{g}''$ .

A (10) A (10)

# $\mathcal K\text{-pairs}$ in the enumeration degrees

## **Definition** (Kalimullin)

A pair of sets  $A, \underline{B}$  are called a  $\mathcal{K}$ -pair if there is a c.e. set W, such that  $A \times B \subseteq W$  and  $\overline{A} \times \overline{B} \subseteq \overline{W}$ .

< 回 > < 三 > < 三 >

 $\mathcal{K}$ -pairs in the enumeration degrees

### Definition (Kalimullin)

A pair of sets A, B are called a  $\mathcal{K}$ -pair if there is a c.e. set W, such that  $A \times B \subseteq W$  and  $\overline{A} \times \overline{B} \subseteq \overline{W}$ .

• A trivial example is  $\{A, U\}$  and  $\{U, A\}$ , where U is c.e.

< 回 > < 三 > < 三 >

# $\mathcal{K}$ -pairs in the enumeration degrees

## Definition (Kalimullin)

A pair of sets A, B are called a  $\mathcal{K}$ -pair if there is a c.e. set W, such that  $A \times B \subseteq W$  and  $\overline{A} \times \overline{B} \subseteq \overline{W}$ .

- A trivial example is  $\{A, U\}$  and  $\{U, A\}$ , where U is c.e.
- If A is a semi-recursive set, then  $\{A, \overline{A}\}$  is a  $\mathcal{K}$ -pair.

< A > < B > < B

# $\mathcal{K}$ -pairs in the enumeration degrees

## **Definition** (Kalimullin)

A pair of sets A, B are called a  $\mathcal{K}$ -pair if there is a c.e. set W, such that  $A \times B \subseteq W$  and  $\overline{A} \times \overline{B} \subseteq \overline{W}$ .

- A trivial example is  $\{A, U\}$  and  $\{U, A\}$ , where U is c.e.
- If A is a semi-recursive set, then  $\{A, \overline{A}\}$  is a  $\mathcal{K}$ -pair.

#### Theorem (Kalimullin)

A pair of sets A, B are a  $\mathcal{K}$ -pair if and only if their enumeration degrees **a** and **b** satisfy:

$$\mathcal{K}(\mathbf{a},\mathbf{b}) \leftrightarrows (\forall \mathbf{x} \in \mathcal{D}_{e})((\mathbf{a} \lor \mathbf{x}) \land (\mathbf{b} \lor \mathbf{x}) = \mathbf{x}).$$

A (10) A (10) A (10) A

## $\mathcal K\text{-pairs}$ are invisible in the Turing universe

*K*-pairs are always quasi-minimal: the only total degree below either of them is **0**<sub>e</sub>.

・ 同 ト ・ ヨ ト ・ ヨ ト

# $\mathcal{K}$ -pairs are invisible in the Turing universe

- K-pairs are always quasi-minimal: the only total degree below either of them is 0<sub>e</sub>.
- A consequence of the existence of nontrivial *K*-pairs in *D<sub>e</sub>* is that the Slaman-Shore property fails, there is a degree a ∠<sub>e</sub> 0'<sub>e</sub>, such that for every g, a ∨ g <<sub>e</sub> g".

We know that:

•  $TOT \cap D_e (\geq \mathbf{0}'_e)$  is first order definable.

æ

<ロ> <問> <問> < 回> < 回> 、

We know that:

- $TOT \cap D_e (\geq \mathbf{0}'_e)$  is first order definable.
- $TOT \cap D_e (\leq \mathbf{0}'_e)$  is first order definable.

< 回 > < 回 > < 回 > -

We know that:

- $TOT \cap D_e (\geq \mathbf{0}'_e)$  is first order definable.
- $\mathcal{TOT} \cap \mathcal{D}_e(\leq \mathbf{0}'_e)$  is first order definable.

Question Is TOT first order definable in  $D_e$ ?

A (10) A (10)

We know that:

- $TOT \cap D_e (\geq \mathbf{0}'_e)$  is first order definable.
- $\mathcal{TOT} \cap \mathcal{D}_e(\leq \mathbf{0}'_e)$  is first order definable.

Question Is TOT first order definable in  $D_e$ ?

Recall that the total degrees are an automorphism base for  $\mathcal{D}_e$ .

We know that:

- $TOT \cap D_e (\geq \mathbf{0}'_e)$  is first order definable.
- $\mathcal{TOT} \cap \mathcal{D}_e(\leq \mathbf{0}'_e)$  is first order definable.

Question Is TOT first order definable in  $D_e$ ?

Recall that the total degrees are an automorphism base for  $\mathcal{D}_e$ .

A positive answer would connect the problems of the existence of a non-trivial automorphism in both structures.

## Theorem (Ganchev,S)

For every nonzero enumeration degree  $\mathbf{u} \in \mathcal{D}_{e}$ ,

```
\mathbf{u}' = max \left\{ \mathbf{a} \lor \mathbf{b} \mid \mathcal{K}(\mathbf{a}, \mathbf{b}) \& \mathbf{a} \leq_{e} \mathbf{u} \right\}.
```

 Suppose that a degree is total if and only if it is the least upper bound of a maximal *K*-pair.

## Theorem (Ganchev,S)

For every nonzero enumeration degree  $\mathbf{u} \in \mathcal{D}_{e}$ ,

```
\mathbf{u}' = max \left\{ \mathbf{a} \lor \mathbf{b} \mid \mathcal{K}(\mathbf{a}, \mathbf{b}) \& \mathbf{a} \leq_{e} \mathbf{u} \right\}.
```

- Suppose that a degree is total if and only if it is the least upper bound of a maximal *K*-pair.
- The relation **x** is c.e. in **u** would also be definable for total degrees by :

$$\exists a \exists b (x = a \lor b \& \mathcal{K}(a, b) \& a \leq_e u).$$

Theorem (Ganchev,S)

For every nonzero enumeration degree  $\mathbf{u} \in \mathcal{D}_{e}$ ,

```
\mathbf{u}' = max \left\{ \mathbf{a} \lor \mathbf{b} \mid \mathcal{K}(\mathbf{a}, \mathbf{b}) \& \mathbf{a} \leq_{e} \mathbf{u} \right\}.
```

- Suppose that a degree is total if and only if it is the least upper bound of a maximal *K*-pair.
- The relation **x** is c.e. in **u** would also be definable for total degrees by :

$$\exists a \exists b (x = a \lor b \& \mathcal{K}(a, b) \& a \leq_e u).$$

 Then for total u, our definition of the jump would read u' is the largest total degree, which is c.e. in u.

# Definability via automorphism analysis in $\mathcal{D}_e$

Slaman and Woodin: Definability in Degree Structures, 1995.

- Coding theorem.
- A characterization of an automorphism in terms of a countable object.
- A finite automorphism base.

Arithmetically representing images of generic degrees

### Theorem (Ganchev, Soskov)

Every automorphism of  $\mathcal{D}_e$  is the identity on the cone above  $\emptyset^4$ .

• Uses a result by Richter in the Turing degrees: If the cone above **a** is isomorphic to the cone above **b** in the structure of the Turing degrees with jump operation then  $\mathbf{a}^2 \leq \mathbf{b}^3$ .

#### Theorem

Let  $\pi$  be an automorphism of  $\mathcal{D}_e$ . There exists an enumeration operator  $\Gamma$  such that for every 8-generic total function g,  $\pi(\mathbf{d}_e(g)) = \mathbf{d}_e(\Gamma(g \oplus \emptyset^4)).$ 

(日)

## Arithmetically representing automorphisms of $\mathcal{D}_e$

### Corollary

Let  $\pi$  be an automorphism of  $\mathcal{D}_e$ . There exists an arithmetic formula  $\varphi$  such that  $\varphi(X, Y)$  is true if and only if  $\pi(\mathbf{d}_e(X)) = \mathbf{d}_e(Y)$ . There are therefore at most countably many automorphisms of  $\mathcal{D}_e$ .
