# The real numbers within the complex numbers

- In his 1545 “Ars Magna”, Cardano provided the first complete expression for the solution of a general cubic equation. In this solution a certain class of cases - ones he referred to as “irreducible” - the equation always has three real solutions, but in order to derive his expression he was forced to take the square root of a negative number.

- Roger Penrose in his book “The road to reality” 2005

The magic of the complex numbers ...“indeed provided a utility and a depth of mathematical insight that could not be achieved by use of the reals alone.”

# The spectrum of relative definability

How can a set of natural numbers  $B$  be used to define a set of natural numbers  $A$ .

- There is an algorithm, which determines whether  $x \in A$  using finite information about memberships in  $B$ : Turing reducibility.
- There is an algorithm, which enumerates instances of memberships in  $A$  from instances of memberships in  $B$ : enumeration reducibility.

- There is an algorithm, which enumerates instances of memberships in  $A$  from instances of memberships in  $B$ : enumeration reducibility.

# Preliminaries: Enumeration reducibility

$A \leq_T B$  iff there is a computable in  $B$  function  $\varphi^B$ , such that  $\chi_A = \varphi^B$ .

$A \leq_T B$  iff  $A \oplus \bar{A}$  is c.e. in  $B$ .

$A \leq_T B$  iff there is a c.e. set  $W$  such that  $x \in A \oplus \bar{A}$  if and only if there are finite sets  $D_B$  and  $D_{\bar{B}}$  such that  $\langle x, D_B \oplus D_{\bar{B}} \rangle \in W$  and  $D_B \oplus D_{\bar{B}} \subseteq B \oplus \bar{B}$ .

## Definition

$A \leq_e B$  if and only if there is a set  $W$ , such that  $A = W(B) = \{x \mid \exists u (\langle x, u \rangle \in W \wedge D_u \subseteq B)\}$ .

Note that  $A \leq_T B$  if and only if  $A \oplus \bar{A} \leq_e B \oplus \bar{B}$ .

# The total degrees

## Proposition

*The embedding  $\iota : \mathcal{D}_T \rightarrow \mathcal{D}_e$ , defined by  $\iota(d_T(A)) = d_e(A \oplus \bar{A})$ , preserves the order, the least upper bound and the jump operation.*

The substructure of the total e-degrees is defined as  $\mathcal{TOT} = \iota(\mathcal{D}_T)$ .

*Note that the enumeration jump of a set  $A' = L_A \oplus \bar{L}_A$  is always total.*

# The total degrees

# Motivation: torsion-free abelian groups of rank 1

A torsion free abelian group of rank 1  $G$  is (isomorphic to) a subgroup of  $(\mathbb{Q}, +, =)$ .

## Definition

Let  $p$  be a prime number and  $a \in G$ .

$$h_p(a) = \begin{cases} \text{the largest } k, & \text{such that } p^k | a \text{ in } G; \\ \infty, & \text{if } \forall k (p^k | a \text{ in } G). \end{cases}$$

Here  $p^k | a$  in  $G$  if there exists  $b \in G$  such that  $p^k \cdot b = a$ .

*Example:* If  $G = \mathbb{Q}$  then for all nonzero  $a$  and all  $p$ ,  $h_p(a) = \infty$ , because for all  $k$ ,  $p^k \cdot \frac{a}{p^k} = a$ .

If  $G = \mathbb{Z}$  then for all nonzero  $a$  and all but finitely many  $p$ ,  $h_p(a) = 0$ .

In fact if  $a, b \neq 0$  then for all but finitely many  $p$ ,  $h_p(a) = h_p(b)$ .

# Motivation: torsion-free abelian groups of rank 1

A torsion free abelian group of rank 1  $G$  is (isomorphic to) a subgroup of  $(\mathbb{Q}, +, =)$ .

The characteristic of an element  $a \in G$  is the sequence:

$$\chi(a) = (h_{p_0}(a), h_{p_1}(a), \dots, h_{p_n}(a), \dots)$$

So if  $a, b \neq 0$  then  $\chi(a) =^* \chi(b)$ .

The type of  $G$ , denoted  $\chi(G)$  is the equivalence class of  $\chi(a)$  for any  $a \neq 0$  in  $G$ .

Baer noticed that there is a TFA1 group of every possible type.

## Theorem (Baer)

*Two torsion-free abelian groups of rank 1 are isomorphic if and only if they have the same type.*

# The type of $G$

Let  $p_0 < p_1 < \dots < p_n \dots$  be an enumeration of all prime numbers.

## Definition

The characteristic of an element  $a \in G$  is the sequence:

$$\chi(a) = (h_{p_0}(a), h_{p_1}(a), \dots, h_{p_n}(a), \dots)$$

So if  $a, b \neq 0$  then  $\chi(a) =^* \chi(b)$ .

The type of  $G$ , denoted  $\chi(G)$  is the equivalence class of  $\chi(a)$  for any  $a \neq 0$  in  $G$ .

Baer noticed that there is a TFA1 group of every possible type.

## Theorem (Baer)

*Two torsion-free abelian groups of rank 1 are isomorphic if and only if they have the same type.*

# The standard type of $G$

## Definition

Let  $S(G) = \{\langle i, j \rangle \mid j \leq \text{the } i\text{-th element of } \chi(G)\}$ .

Note that every  $S$  can be coded as (is  $m$ -equivalent to)  
 $\{\langle i, j \rangle \mid j = 0 \vee i \in S \ \& \ j = 1\}$ .

## Theorem (Downey, Jockusch)

*The degree spectrum of  $G$ :  $\{d_T(H) \mid H \cong G\}$  is precisely  $\{\text{deg}_T(Y) \mid S(G) \text{ is c.e. in } Y\}$ .*

*$c'_\mu(A)$  exists for all  $A$  if and only if for every torsion-free abelian group  $G$  the jump spectrum of  $G$ , the set  $\{d_T(H)' \mid H \cong G\}$  has a least element.*

## Corollary (Coles, Downey, Slaman)

*Every every torsion-free abelian group of rank 1  $G$  has a jump degree.*

# The case of principal ideals

Let  $G$  be a torsion-free abelian group of rank 1.

Recall that the degree spectrum of  $G$ :  $\{d_T(H) \mid H \cong G\}$  is precisely  $\{\text{deg}_T(Y) \mid S(G) \text{ is c.e. in } Y\}$ .

So the enumeration degree spectrum of  $G^+$  is

$$DS_e(G^+) = \{\mathbf{a} \mid \mathbf{a} \in \mathcal{TOT} \ \& \ d_e(S(G)) \leq_e \mathbf{a}\}.$$

Denote  $d_e(S(G))$  by  $\mathbf{s}_G$ -the type degree of  $G$ .

# The case of principal ideals

Let  $G$  be a torsion-free abelian group of rank 1.

Recall that the degree spectrum of  $G$ :  $\{d_T(H) \mid H \cong G\}$  is precisely  $\{deg_T(Y) \mid S(G) \text{ is c.e. in } Y\}$ .

So the enumeration degree spectrum of  $G^+$  is

$$DS_e(G^+) = \{\mathbf{a} \mid \mathbf{a} \in \mathcal{TOT} \ \& \ d_e(S(G)) \leq_e \mathbf{a}\}.$$

Denote  $d_e(S(G))$  by  $\mathbf{s}_G$ -the type degree of  $G$ .

# The case of principal ideals

Let  $G$  be a torsion-free abelian group of rank 1.

Recall that the degree spectrum of  $G$ :  $\{d_T(H) \mid H \cong G\}$  is precisely  $\{\text{deg}_T(Y) \mid S(G) \text{ is c.e. in } Y\}$ .

So the enumeration degree spectrum of  $G^+$  is

$$DS_e(G^+) = \{\mathbf{a} \mid \mathbf{a} \in \mathcal{TOT} \ \& \ d_e(S(G)) \leq_e \mathbf{a}\}.$$

Denote  $d_e(S(G))$  by  $\mathbf{s}_G$ -the type degree of  $G$ .

# TFA groups in the e-degrees

$$DS_e(G^+) = \{\mathbf{a} \mid \mathbf{a} \in \mathcal{TOT} \ \& \ \mathbf{s}_G \leq \mathbf{a}\}$$

## Theorem (Soskov)

- 1 The co-spectrum of  $G^+$  is  $CS(G^+) = \{\mathbf{b} \mid \mathbf{b} \leq \mathbf{s}_G\}$ . Hence  $G^+$  always has co-degree:  $\mathbf{s}_G$ .
- 2 Every principal ideal of e-degrees can be represented as the co-spectrum of a torsion-free abelian group of rank 1.

- 1 Follows from Selman's theorem: if  $\mathbf{a}$  and  $\mathbf{b}$  are bounded by the same total degrees then  $\mathbf{a} = \mathbf{b}$ .
- 2 Follows from the observation that every set  $S$  can be coded as a standard type of a group.

# TFA groups in the e-degrees

$$DS_e(G^+) = \{\mathbf{a} \mid \mathbf{a} \in \mathcal{TOT} \ \& \ \mathbf{s}_G \leq \mathbf{a}\}$$

## Theorem (Soskov)

- 1 The co-spectrum of  $G^+$  is  $CS(G^+) = \{\mathbf{b} \mid \mathbf{b} \leq \mathbf{s}_G\}$ . Hence  $G^+$  always has co-degree:  $\mathbf{s}_G$ .
  - 2 Every principal ideal of e-degrees can be represented as the co-spectrum of a torsion-free abelian group of rank 1.
-

### Theorem (Slaman and Woodin)

*A uniformly low antichain can be coded by parameters in  $\mathcal{D}_e(\leq \mathbf{0}'_e)$ .*

- 1 Non-trivial  $\Sigma_2^0$   $\mathcal{K}$ -pairs are low.
- 2  $\mathcal{K}$ -systems form antichains.
- 3 Every nonzero  $\Delta_2^0$  e-degree bounds a countable  $\mathcal{K}$ -system.

## $\mathcal{D}_e(\leq \mathbf{0}'_e)$ : Ganchev and S

Initial motivation: Prove that the theory of first order arithmetic is interpretable in  $\mathcal{D}_e(\leq \mathbf{0}'_e)$ .

### Theorem (Slaman and Woodin)

# An obstacle

$$\mathcal{K}(\mathbf{a}, \mathbf{b}) \Leftrightarrow (\forall \mathbf{x})((\mathbf{a} \vee \mathbf{x}) \wedge (\mathbf{b} \vee \mathbf{x}) = \mathbf{x})$$

Is it enough to require that this formula is satisfied by all  $\Sigma_2^0$  e-degrees?

## Theorem (Ganchev, S)

*There is a first order formula  $\mathcal{L}\mathcal{K}(x, y)$ , which defines  $\mathcal{K}$ -pairs in  $\mathcal{D}_e(\leq \mathbf{0}'_e)$ .*

*Proof flavor:* We add a cupping property to the formula  $\mathcal{K}(x, y)$ , proved with a priority construction, similar to Harrington's non-splitting.

## Corollary (Ganchev, S)

$Th(\mathcal{D}_e(\leq \mathbf{0}'_e)) \equiv_1 Th(\mathbb{N})$ .

# An obstacle

$$\mathcal{K}(\mathbf{a}, \mathbf{b}) \Leftrightarrow (\forall \mathbf{x})((\mathbf{a} \vee \mathbf{x}) \wedge (\mathbf{b} \vee \mathbf{x}) = \mathbf{x})$$

# An easy consequence

## Theorem

*The class of downwards properly  $\Sigma_2^0$  enumeration degrees is first order definable in  $\mathcal{D}_e(\leq \mathbf{0}'_e)$ .*

**a** is downwards properly  $\Sigma_2^0$  if and only if it bounds no  $\mathcal{K}$ -pairs.

# A more important consequence

Jockusch:

For every incomputable set  $B$  there is a semi-recursive set  $A \equiv_T B$  such that both  $A$  and  $\bar{A}$  are not c.e.

It is not hard to see that a  $\mathcal{K}$ -pair of the form  $\{A, \bar{A}\}$  is maximal, i.e. it cannot be extended to a  $\mathcal{K}$ -pair  $(B, C)$ , with  $A <_e B$  or  $\bar{A} <_e C$

## Corollary

*Every nonzero total enumeration degree can be represented as the least upper bound of a maximal nontrivial  $\mathcal{K}$ -pair.*

## Theorem (Ganchev, S)

*For every nontrivial  $\Delta_2^0$   $\mathcal{K}$ -pair can be extended to a maximal.*

*The class of total degrees is first order definable in  $\mathcal{D}_e(\leq \mathbf{0}'_e)$ .*

# A more important consequence

# Open question

We know that:

- $TOT \cap \mathcal{D}_e(\geq \mathbf{0}'_e)$  is first order definable.
- $TOT \cap \mathcal{D}_e(\leq \mathbf{0}'_e)$  is first order definable.

## Question

*Is  $TOT$  first order definable in  $\mathcal{D}_e$ ?*

Recall that the total degrees are an automorphism base for  $\mathcal{D}_e$ .

A positive answer would connect the problems of the existence of a non-trivial automorphism in both structures.

# Open question
