### Definition

Let  $\mathcal{A}$  be a structure. A set  $B \subseteq |\mathcal{A}|$  is an automorphism base for  $\mathcal{A}$  if whenever f and g are automorphisms of  $\mathcal{A}$  such that  $(\forall x \in B)(f(x) = g(x))$ , then f = g.

### Definition

Let  $\mathcal{A}$  be a structure. A set  $B \subseteq |\mathcal{A}|$  is an automorphism base for  $\mathcal{A}$  if whenever f and g are automorphisms of  $\mathcal{A}$  such that  $(\forall x \in B)(f(x) = g(x))$ , then f = g.

Equivalently if *f* is an automorphism of A and  $(\forall x \in B)(f(x) = x)$  then *f* is the identity.

### Definition

Let  $\mathcal{A}$  be a structure. A set  $B \subseteq |\mathcal{A}|$  is an automorphism base for  $\mathcal{A}$  if whenever f and g are automorphisms of  $\mathcal{A}$  such that  $(\forall x \in B)(f(x) = g(x))$ , then f = g.

Equivalently if *f* is an automorphism of A and  $(\forall x \in B)(f(x) = x)$  then *f* is the identity.

### Theorem (Slaman and Woodin)

There is an element  $\mathbf{g} \leq \mathbf{0}^{(5)}$  such that  $\{\mathbf{g}\}$  is an automorphism base for the structure of the Turing degrees  $\mathcal{D}_T$ .

### Definition

Let  $\mathcal{A}$  be a structure. A set  $B \subseteq |\mathcal{A}|$  is an automorphism base for  $\mathcal{A}$  if whenever f and g are automorphisms of  $\mathcal{A}$  such that  $(\forall x \in B)(f(x) = g(x))$ , then f = g.

### Theorem (Slaman and Woodin)

There is an element  $\mathbf{g} \leq \mathbf{0}^{(5)}$  such that  $\{\mathbf{g}\}$  is an automorphism base for the structure of the Turing degrees  $\mathcal{D}_T$ .

 $Aut(\mathcal{D}_T)$  is countable and every member has an arithmetically definable presentation.

*Every relation induced by a degree invariant definable relation in Second order arithmetic is definable with parameters.* 

# Local structure of the Turing degrees

#### Definition

 $\mathcal{D}_T(\leq \mathbf{0}')$  is the substructure of all degrees that are bounded by  $\mathbf{0}'$ , the  $\Delta_2^0$ Turing degrees.

# Local structure of the Turing degrees

#### Definition

 $\mathcal{D}_T(\leq \mathbf{0}')$  is the substructure of all degrees that are bounded by  $\mathbf{0}'$ , the  $\Delta_2^0$ Turing degrees.

Shore (1981) proved that the theory of  $\mathcal{D}_T (\leq \mathbf{0}')$  is computably isomorphic to the theory of first order arithmetic.

# Local structure of the Turing degrees

### Definition

 $\mathcal{D}_T(\leq \mathbf{0}')$  is the substructure of all degrees that are bounded by  $\mathbf{0}'$ , the  $\Delta_2^0$ Turing degrees.

Shore (1981) proved that the theory of  $\mathcal{D}_T (\leq \mathbf{0}')$  is computably isomorphic to the theory of first order arithmetic.

### Question

Can we show that  $\mathcal{D}_T(\leq \mathbf{0}')$  relates to first order arithmetic in the same way that  $\mathcal{D}_T$  relates to second order arithmetic?

### An indexing of the c.e. degrees

#### The Goal

Extend this result to an indexing  $\varphi$  of the  $\Delta_2^0$  Turing degrees.

We will call *e* an index for a  $\Delta_2^0$  set *X* if  $\{e\}^{\emptyset'}$  is the characteristic function of *X*.

### The Goal

Extend this result to an indexing  $\varphi$  of the  $\Delta_2^0$  Turing degrees.

We will call *e* an index for a  $\Delta_2^0$  set *X* if  $\{e\}^{\emptyset'}$  is the characteristic function of *X*.

### The Goal

Extend this result to an indexing  $\varphi$  of the  $\Delta_2^0$  Turing degrees.

We will call *e* an index for a  $\Delta_2^0$  set *X* if  $\{e\}^{\emptyset'}$  is the characteristic function of *X*.

### The Goal

Extend this result to an indexing  $\varphi$  of the  $\Delta_2^0$  Turing degrees.

We will call *e* an index for a  $\Delta_2^0$  set *X* if  $\{e\}^{\emptyset'}$  is the characteristic function of *X*.

*Idea:* We can use a further uniformly low set  $\mathcal{Z} = \{d_T(Z_i) \mid i < \omega\}.$ 

### The Goal

Extend this result to an indexing  $\varphi$  of the  $\Delta_2^0$  Turing degrees.

We will call *e* an index for a  $\Delta_2^0$  set *X* if  $\{e\}^{\emptyset'}$  is the characteristic function of *X*.

*Idea:* We can use a further uniformly low set  $\mathcal{Z} = \{d_T(Z_i) \mid i < \omega\}.$ 

### Theorem (Slaman, S)

There are finitely many  $\Delta_2^0$  parameters that code a model of arithmetic  $\mathcal{M}$  and an indexing of the  $\Delta_2^0$  degrees.

### Theorem (Slaman, S)

There are finitely many  $\Delta_2^0$  parameters that code a model of arithmetic  $\mathcal{M}$  and an indexing of the  $\Delta_2^0$  degrees.

Proof flavour:

• A  $\Delta_2^0$  degree can be defined from four low degrees using meet and join.

### Theorem (Slaman, S)

There are finitely many  $\Delta_2^0$  parameters that code a model of arithmetic  $\mathcal{M}$  and an indexing of the  $\Delta_2^0$  degrees.

Proof flavour:

- A  $\Delta_2^0$  degree can be defined from four low degrees using meet and join.
- There exists a uniformly low set of Turing degrees Z, such that every low Turing degree x is uniquely positioned with respect to the c.e. degrees and the elements of Z.

### Theorem (Slaman, S)

There are finitely many  $\Delta_2^0$  parameters that code a model of arithmetic  $\mathcal{M}$  and an indexing of the  $\Delta_2^0$  degrees.

Proof flavour:

- A  $\Delta_2^0$  degree can be defined from four low degrees using meet and join.
- There exists a uniformly low set of Turing degrees Z, such that every low Turing degree x is uniquely positioned with respect to the c.e. degrees and the elements of Z.
  - If  $\mathbf{x}, \mathbf{y} \leq \mathbf{0}', \mathbf{x}' = \mathbf{0}'$  and  $\mathbf{y} \leq \mathbf{x}$  then there are  $\mathbf{g}_i \leq \mathbf{0}'$ , c.e. degrees  $\mathbf{a}_i$  and  $\Delta_2^0$  degrees  $\mathbf{c}_i, \mathbf{b}_i \in \mathcal{Z}$  for i = 1, 2 such that:
    - **9**  $\mathbf{g}_i$  is the least element below  $\mathbf{a}_i$  which joins  $\mathbf{b}_i$  above  $\mathbf{c}_i$ .
    - $2 x \leq \mathbf{g}_1 \vee \mathbf{g}_2.$

Theorem

 $\mathcal{D}_T(\leq \mathbf{0'})$  has a finite automorphism base.

A (1) > A (1) > A (1) >

#### Theorem

 $\mathcal{D}_T(\leq \mathbf{0'})$  has a finite automorphism base.

*Proof:* Let  $\pi$  be an automorphism that fixes the parameters that code a model of arithmetic  $\mathcal{M}$  and an indexing of the  $\Delta_2^0$  degrees.

#### Theorem

 $\mathcal{D}_T(\leq \mathbf{0'})$  has a finite automorphism base.

*Proof:* Let  $\pi$  be an automorphism that fixes the parameters that code a model of arithmetic  $\mathcal{M}$  and an indexing of the  $\Delta_2^0$  degrees.

Then  $\pi$  fixes every degree that represents a natural number in  $\mathcal{M}$ .

#### Theorem

 $\mathcal{D}_T(\leq \mathbf{0'})$  has a finite automorphism base.

*Proof:* Let  $\pi$  be an automorphism that fixes the parameters that code a model of arithmetic  $\mathcal{M}$  and an indexing of the  $\Delta_2^0$  degrees.

Then  $\pi$  fixes every degree that represents a natural number in  $\mathcal{M}$ .

Hence  $\pi$  fixes every  $\Delta_2^0$  Turing degree.

#### Corollary

The automorphism group of  $\mathcal{D}_T(\leq \mathbf{0}')$  is countable.

#### Theorem

 $\mathcal{D}_T(\leq \mathbf{0'})$  has a finite automorphism base.

*Proof:* Let  $\pi$  be an automorphism that fixes the parameters that code a model of arithmetic  $\mathcal{M}$  and an indexing of the  $\Delta_2^0$  degrees.

Then  $\pi$  fixes every degree that represents a natural number in  $\mathcal{M}$ .

Hence  $\pi$  fixes every  $\Delta_2^0$  Turing degree.

#### Corollary

The automorphism group of  $\mathcal{D}_T(\leq \mathbf{0}')$  is countable. Every automorphism of  $\mathcal{D}_T(\leq \mathbf{0}')$  has an arithmetic presentation.

### Definition

We say that a structure is atomic if the complete type of every tuple is axiomatized by a single formula.

Theorem

 $\mathcal{D}_T(\leq \mathbf{0}')$  is atomic.

> < E > < E >

### Definition

We say that a structure is atomic if the complete type of every tuple is axiomatized by a single formula.

Theorem

 $\mathcal{D}_T(\leq \mathbf{0}')$  is atomic.

*Proof flavour:* Transform the indexing of the  $\Delta_2^0$  degrees into a bijection  $\theta : \mathbb{N} \to \mathcal{D}_T (\leq \mathbf{0}').$ 

### Definition

We say that a structure is atomic if the complete type of every tuple is axiomatized by a single formula.

Theorem

 $\mathcal{D}_T(\leq \mathbf{0}')$  is atomic.

*Proof flavour:* Transform the indexing of the  $\Delta_2^0$  degrees into a bijection  $\theta : \mathbb{N} \to \mathcal{D}_T (\leq \mathbf{0}').$ 

Now every tuple  $(\mathbf{x}_1 \dots \mathbf{x}_n)$  corresponds to a unique tuple of natural numbers  $(e_1, \dots e_n)$ , such that  $\theta(e_i^{\mathcal{M}}) = \mathbf{x}_i$ .

・ 回 ト ・ ヨ ト ・ ヨ ト …

### Definition

We say that a structure is atomic if the complete type of every tuple is axiomatized by a single formula.

Theorem

 $\mathcal{D}_T(\leq \mathbf{0}')$  is atomic.

*Proof flavour:* Transform the indexing of the  $\Delta_2^0$  degrees into a bijection  $\theta : \mathbb{N} \to \mathcal{D}_T (\leq \mathbf{0}').$ 

Now every tuple  $(\mathbf{x}_1 \dots \mathbf{x}_n)$  corresponds to a unique tuple of natural numbers  $(e_1, \dots, e_n)$ , such that  $\theta(e_i^{\mathcal{M}}) = \mathbf{x}_i$ .

The formula for the tuple  $(\mathbf{x}_1 \dots \mathbf{x}_n)$  expresses this relationship: whenever  $\vec{\mathbf{p}}$  are parameters that define a standard model of arithmetic and a bijection  $\theta$  that respects the constraints of an indexing,  $\theta$  maps  $e_i^{\mathcal{M}}$  to  $\mathbf{x}_i$ .

If  $\mathcal{R}$  is invariant under automorphisms, then  $\mathcal{R}$  is definable without parameters.

*Proof:* Let  $\mathcal{M}$  be a model of arithmetic and  $\varphi$  an indexing of the  $\Delta_2^0$  degrees. We define the set of all  $(\varphi(e_1^{\mathcal{M}}), \dots, \varphi(e_n^{\mathcal{M}}))$  where  $\mathcal{M} \models R(e_1, \dots e_n)$ .

#### Theorem

Every relation  $\mathcal{R} \subseteq \mathcal{D}_T(\leq \mathbf{0}')$  induced by an arithmetically definable degree invariant relation  $\mathcal{R}$  is definable with finitely many  $\Delta_2^0$  parameters. If  $\mathcal{R}$  is invariant under automorphisms, then  $\mathcal{R}$  is definable without parameters.

*Proof:* Let  $\mathcal{M}$  be a model of arithmetic and  $\varphi$  an indexing of the  $\Delta_2^0$  degrees. We define the set of all  $(\varphi(e_1^{\mathcal{M}}), \ldots, \varphi(e_n^{\mathcal{M}}))$  where  $\mathcal{M} \models R(e_1, \ldots, e_n)$ . We use the same trick as in the previous application to define  $\mathcal{R}$  in the second case.

#### Theorem

 $\mathcal{D}_T(\leq \mathbf{0}')$  is rigid if and only if  $\mathcal{D}_T(\leq \mathbf{0}')$  is biinterpretable with first order arithmetic.

*Proof:*  $\mathcal{D}_T (\leq \mathbf{0}')$  is biinterpretable with first order arithmetic if there are a definable model of arithmetic and indexing of the  $\Delta_2^0$  degrees.

#### Theorem

 $\mathcal{D}_T(\leq \mathbf{0}')$  is rigid if and only if  $\mathcal{D}_T(\leq \mathbf{0}')$  is biinterpretable with first order arithmetic.

*Proof:*  $\mathcal{D}_T(\leq \mathbf{0}')$  is biinterpretable with first order arithmetic if there are a definable model of arithmetic and indexing of the  $\Delta_2^0$  degrees. If the empty set is an automorphism base then  $\mathcal{D}_T(\leq \mathbf{0}')$  is rigid.

#### Theorem

 $\mathcal{D}_T(\leq \mathbf{0}')$  is rigid if and only if  $\mathcal{D}_T(\leq \mathbf{0}')$  is biinterpretable with first order arithmetic.

*Proof:*  $\mathcal{D}_T(\leq \mathbf{0}')$  is biinterpretable with first order arithmetic if there are a definable model of arithmetic and indexing of the  $\Delta_2^0$  degrees. If the empty set is an automorphism base then  $\mathcal{D}_T(\leq \mathbf{0}')$  is rigid.

If  $\mathcal{D}_T(\leq \mathbf{0}')$  is rigid then the tuple of the finitely many indexing parameters is an example of a relation  $\mathcal{R}$  that is induced by an arithmetically definable degree invariant relation R and  $\mathcal{R}$  is invariant under automorphisms.
